Get them all ;)

Suppose you have an API
- GET api/users, api/users/:id
- GET api/customers, api/customers:id
- GET api/countries etc

You also have a SPA where you fetch users and customers and countries from API to render some page. Probably you don't want to make 3 or 5 or 10 ajax requests, instead you want to GET all resources in one go.

The task
Make API handle that - build a reusable module/middleware for GETting multiple resources in one go. *Should be easy to inject into any existing express app / api*.

Example of final use
- GET api/resources ? users=api/users & customer=api/customers/23 & countries=api/countries ..
returns {users: [..], customer: {..}, countries: [..] }

hints:
- you like good performance and streams, right?
- you like elegant and reliable test suits same as we do?
- you like to publish modules your are proud of to npm? with travis banner? wow man!

Good luck!
